

A BRILLIANT WAY TO SAVE THE WORLD.

SCROLL DOWN.....

Rising sea levels. Global warming. An atmosphere thick with carbon dioxide. Sometimes it seems the end of the world is nigh and no one's doing anything to stop it.

Well here's something very important you can do. Support renewable forestry. Renewable forestry, at its simplest, means that when a tree is taken out it is very quickly replaced. This is particularly good for the planet because a growing tree actively absorbs harmful carbon dioxide. And, because the production of wood products uses far less fossil fuel than other building and manufactured materials, the increased use of wood is naturally far better for the environment. It stands to reason that the more wood we use, the more trees we'll need, and the more trees we plant, the more carbon dioxide will be absorbed.

So there you have it – use more wood and help save the world. Brilliant, don't you think?
